

What is CarboSchool?

It is an opportunity for students to learn about climate change and environmental sustainability by establishing a teacher-scientist partnership.

Why bother?

Today's students are the politicians and decision-makers of tomorrow; the future of the environment and society will lie in their hands. It is therefore decisive that they make sound decisions based on the best available scientific information.

How does it work?

A teacher and a scientist get together to design a project for the class or a group of voluntary students. The project can last from few weeks to few months depending on the goals and resources available. A long-lasting relationship with the school might be established.

Who can participate?

The offer is targeted to secondary schools, students ages 15 to 19.

We offer....

- * Hands-on experiments on physical phenomena, greenhouse effect, climate & weather, etc.
- * Follow your scientist on a scientific cruise expedition in the Greenland Sea.
- * Learn to organise information, analyse data and develop a product of your results (CD, web site, newspaper article, etc)
- * Present your project to scientists and journalists
- * Share your results and experience with students from all over Europe
